Candle Care

To ensure you get the best use and value for money out of your candle you should know the following:

CREATE A BURN MEMORY

- When lighting your Soy Candle for the first time, allow the wax to melt all the way to the edge of the jar.
- This will give maximum fragrance to the candle and create an even memory burn.

TRIM THE WICK

- Soy wax does not burn as hot as paraffin wax. Soy candles require a thicker wick, which does not burn 100% and needs to be trimmed regularly.
- Always trim your wick to about 6-8mm before you re-light your candle. This will ensure a long-lasting candle, minimise soot and remove any mushrooming of the wick left from the previous burn.
- If you do not trim the wick regularly and the candle is in a draft or is left to burn too long you may get a mushroom of carbon at the end of the wick. This may cause some soot to collect on the inside of the container.

DO NOT BLOW OUT

- Extinguish your candle by using a snuffer. This will stop the wick smoking and will help with re-lighting the next time. Snuffers are available to buy from Essentialiese Soy Candles.

APPEARANCE

- Please remember each candle and melts are hand poured. Although every effort is made to ensure consistency, every candle will be different.
- The top of your candle may also appear slightly uneven, this is also a sign of natural soy wax being hand poured.
- Remember not to leave your candle in direct sunlight as it will discolour. This does not affect the use of the candle in any way.

Refill Service

At Essentialiese I want to do whatever I can to help the environment so I would like to offer a refill service. If you keep your old candle jars, give them to me and I will refill them for you. I will clean and prepare your jars and refill them with your desired fragrance or essential oil ready for collection. My refill service will be at a discounted price off your next candle/candles.

Why Soy?

CLEAN BURNING — Unlike paraffin wax, Soy wax is non-toxic and burns cleaner. With no petrol — carbon soot which can blacken walls, ceilings and furniture in your home, as well as dispersing toxins into the air you breathe.

LONG BURNING — Soy wax candles burn slower and cooler than paraffin wax, creating a longer lasting burning candle.

BIODEGRADABLE — Soy wax is naturally biodegradable. Soy wax is also easier to remove from materials and other surfaces than paraffin wax.
